                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is bovine chymotrypsinogen. It was included in a review of sequence homologies of several plasminogen activators. Plasminogen is the principal series protease zymogen in the extracellular fluids of vertebrates. Its active form, plasmin, is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen expression is regulated by plasminogen activators which hydrolyse a peptide bond in plasminogen to convert it to plasmin or form tight binding complexes with plasminogen to spontaneously convert it to plasmin. The sequence homology analysis has identified a six amino acid peptide involved in

plasminogen activation. This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length human plasminogen. Novel plasminogen activators have been made based upon the plasminogen activation/recognition site of plasminogen binding proteins. The polypeptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast,

The product is useful in reluvenating the elasticity of the arterial wall, and improving unusual serum lipid levels and lipoprotein metabolism.

over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving considers in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating the polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations considers in the constant of the polypeptide and polynucleotide sequences have applications in diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wIpo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2 LLLSLTLSLVLLGSSWGCGVPAITPALSYNQRIVNGENAVPGSWPWQVSLQDNTG---FH 58

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This protein is a plasminogen mutant cleavable by Factor Xa. Activation is localised to the thrombus because cleavage to plasmin is by an enzyme of the blood clotting pathway. Compositions comprising the mutant plasminogen are used for treatment or prevention of thrombosis, etc.

Patent No. US20020090625A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: The Brigham and Women's Hospital, Inc.
APPLICANT: Work, Samuel
APPLICANT: Wong, Kwong-kwok
TITLE OF INVENTION: Methods of Detecting Cancer Based on Prostasin
FILE REFERENCE: 81994/282423
                                                                                                             Sequence 695, Application US/09925297
Patent No. US20020081659A1
GENERAL INFORMATION:
APPLICANT: Rosen et al.
TITLE OF INVENTION: Nucleic Acids, Proteins and Antibodies
FILE REFERENCE: PA105
                                                                                                                                                                                                         CURRENT APPLICATION NUMBER: US/09/925,297

Sequence 14, Application US/09052778A

Patent No. 6060590

GENERAL INFORMATION:
APPLICANT: Bryant, Peter J.
APPLICANT: Bryant, Razuo
TITLE OF INVENTION: CHITINASE RELATED PROTEINS AND METHODS
TITLE OF INVENTION: OF USE
FILE REFERENCE: 07306/015001
CURRENT APPLICATION NUMBER: US/09/052,778A

CURRENT FILING DATE: 1998-03-31
NUMBER OF SEQ ID NOS: 16

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO. 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 441;

Patent No. 6204040

GENERAL INFORMATION:
APPLICANT: Choi, Eui-Sung

APPLICANT: Lee, Eun-Hae

TITLE OF INVENTION: Gluconobacter Suboxydans Sorbitol Dehydrogenase, Genes

TITLE OF INVENTION: and Methods of Use Thereof

TITLE OF INVENTION: and Methods of Use Thereof

CURRENT APPLICANTON and Methods of Use Thereof

CURRENT PELICAND NUMBER: US/09/296,284A

SOFFWARE: PatentIn Ver. 2.0

SEQ ID NO 6

LENGTH: 306
                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             APPLICANT: Choi, Eui-Sung

RESULT 1
          AAB11711
```

```
The invention relates to novel serine proteases designated BSSP5

(AAB11710-B11711), and to nucleic acids encoding them (AAA61731-A61734).
The invention also relates to vectors and transformants comprising BSSP5
nucleic acids; transgenic animals in which the expression level of BSSP5
can be varied; and an mBSSP5 knockout mouse. The invention additionally
cancipasses anti-BSSP5 antibodies and methods of production of such
antibodies, methods of BSSP5 detection using the antibodies, and the
cuse of BSSP5 proteins or fragments as diagnostic markers for certain
medical conditions, e.g., pencreatitis A method for detecting
pancreatitis comprising measuring BSSP5 concentration in the blood or
urine, and a pancreatitis diagnostic agent containing an anti-BSSP5
antibody is also disclosed. Nucleotides encoding BSSP5 were initially
solated in a human brain cDNA library using degenerate PCR primers
(AAA61744-A61745) based on conserved regions of serine proteases. The
BSSP5 serine proteases and nucleotides encoding them are useful in
BSSP5 serine proteases and nucleotides encoding them are useful in
samples (e.g., blood, union, brain, prostate gland, placenta, testis,
pancreas and spleen) as diagnostic markers for conditions such as
pancreas and spleen) as diagnostic markers for conditions such as
conditions and prostatic hypertrophy. Sequence AAB11710 represents
conserved.
Chuman BSSP5 (hBSSP5), and sequence AAB11711 represents murine BSSP5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BSSP5; serine protease; human; hBSSP5; mouse; mBSSP5; brain; diagnostic marker; antibody; transgenic animal; Alzheimer's disease; epilepsy; cancer; inflammation; infertility; pancreatitis; prostatic hypertrophy.
polymorphic variants as markers for diagnosis of e.g. Alzheimer's disease, epilepsy, cancer and inflammation, using blood, urine, pancreas or other tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Serine proteases BSSP5, useful in detecting homologs, mutants and

ó

```
The invention relates to novel serine proteases designated BSSP5

(AABI1710-B11711), and to nucleic acids encoding them (AAA61733-A61734).

The invention also relates to vectors and transformants comprising BSSP5

nucleic acids; transgenic animals in which the expression level of BSSP5

can be varied; and an mBSSP5 knockout mouse. The invention additionally

encompasses anti-BSSP5 antibodies and methods of production of such

antibodies, methods of BSSP5 detection using the antibodies, and the

cuse of BSSP5 proteins or fragments as diagnostic markers for certain

antibodial conditions, e.g., pancreatitis. A method for detecting

pancreatitis comprising measuring BSSP5 concentration in the blood or

urine, and a pancreatitis diagnostic agent containing an anti-BSSP5

antibody is also disclosed. Nucleotides encoding BSSP5 were initially
isolated in a human brain cDNA library using degenerate PCR primers

(AAA61744-A61745) based on conserved regions of serine proteases. The
BSSP5 serine proteases and nucleotides encoding them are useful in
detecting homologues, mutants and polymorphic variants in biological
samples (e.g., blood, urine, brain, prostate gland, placenta, testis,
pancreas and spleen) as diagnostic markers for conditions such as
Alzheimer's disease, epilepsy, cancer, inflammation, infertility,
chuman BSSP5 (BBSSP5), and sequence AABI1711 represents murine BSSP5

contracts and prostatic hypertrophy. Sequence AABI1711 represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    detection; diagnosis; identification; cytostatic; neuroprofective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinflammatory; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
polymorphic variants as markers for diagnosis of e.g. Alzheimer's disease, epilepsy, cancer and inflammation, using blood, urine, pancreas or other tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

TAAB54466. The human pancreatic cancer antigens have cytostatic.

Chapter human pancreatic cancer antigens have cytostatic.

Chapter herapy the polynculectide and proteins can be used for an gene therapy. The polynculectide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a cubject. Binding partners to the proteins and the activity of the proteins and the activity of the carcer is an be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Concept and antagonists to the antigens can be screened for. The pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage can allysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including conteins can be used to generate antibodies both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate antibodies conteins can be used to treat or prevent neural, immune system, muscular, represent content of the proteins can adjoin the and margal to an antibodies of proliferative disorders. sequences, corresponding to human secreted proteins. AAY6651 to
AAY65438 represent the EST-related proteins corresponding to AAZ4265 to
AAX4655. The S. ESTs can be used for producing secreted human gene
products. They can be used for producing secreted human gene
products. They can be used for producing secreted human gene
cejons (UTRs) and upstream regulatory regions which control the
coation, development stage, rate, and quantity of protein synthesis, well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forenist procedures to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in coating expression. The products may also be used in customers to identify individuals having senetic diseases resulting from abnormal gene expression. The products may also be used in customer expression actids encoding signal peptides can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; protease; cancer; immune-related disorder; cardiovascular disease; neuronal-associated disease; metabolic disorder; inflammatory disorder; nervous system disorder; sexual dysfunction; pain; mood disorder; hypertension; psychotic disorder; neurological disorder; dyskinesia; viral infection; human immunodeficiency virus; HIV; non-viral infection; ocular disease; cytostatic; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42264 and AAY64644 to AAX46265 represent
                                           diagnostic, forensic, gene therapy, and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                  AAZ42265 to AAZ43075 represent, novel 5' expressed sequence tag (EST)

```
The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. rheumatoid arthritis and positasis), central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, modisorders, attention disorders, hypotension, hypertension, psychotic disorders, neurological disorders. hypotension, hypertension, psychotic disorders, neurological disorders. Che nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular cheases of cheases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; pancreas; pancreatic cancer; pancreatic cancer antigen; detection; diagnosis; identification; cytostatic; neuroprotective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinflammatory; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative.
                                  Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid that is a pancreatic cancer antigen for preventing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                        human secreted proteins, and encode the proteins given in AAX10531 to human secreted proteins, and encode the proteins given in AAX11533 to human secreted proteins, and encode the proteins given in AAX11533 to AAX11679, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used for producing secreted human gene products. They proteins obtained may have cytokine activity, call proliferation/differentiation activity, haematopoies is requiating activity, tissue growth regulating activity, reproductive hormone regulating activity, encoductive hormone regulating activity, chemotactic/ chemokinetic activity, haemostatic activity, exceptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping promoter sequences. The nucleic acids encoding the signal peptide can be used for directing aximal peptide can be used for directing aximal peptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                             ö

The inversion tractory and free control of the GPCR, a specific active portion and its encoding polynuclectide. Also included are an agonist, antagonist or inhibitor of the GPCR or the polynuclectide, a cell transformed by the vector, a non-thuman mammal comprising a partial or total deletion of the polynuclectide encoding the receptor and screening (detection and possibly, recovering) of compounds which are known or not known to be agonist, antagonists or inhibitors of natural compounds to the GPCR. The receptor-derived agonists, antagonists, inhibitors or compounds are used as an agonists, inhibitors or compounds are used as an event in provement, elimination or substitution of an existing taste and/or a tragrance of (or in) the food and/or cosmetic products. They can also be used in the preparation of medicament in the treatment and/or prevention of a mammalian disorder, such as cell migration, sterility, psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, depression, for promoting axonal growth, nerve cell connection and nerve regeneration for modulating maile and female
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; olfactory receptor; OR; primary scent determination; secondary scent determination; polypeptide library; odour receptor; scent profile; scent fingerprint; scent representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotides which encode polypeptides involved in olfactory sensation for identifying olfactory agonists and antagonists \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               behaviours, such as stimulation or suppression of appetite, sexual motivation, sexual attraction, aggression and for promoting or suppressing chemical communication between organisms. The present
                                                                                 The invention relates to olfactory and Pheromone G-protein coupled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence is a human olfactory and pheromone GPCR protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prevention or the treatment by stimulation of several mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                         ò
                                one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation of calso called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory (x)

The present sequence is a polypeptide encoded by one of 344 newly mined human genes. It was used as a query sequence in a database search of chuman genes. It was used as a query sequence in a database search of chiactory receptor (OR) like sequences. The invention relates to isolated polymucleotides encoding polypeptides involved in olfactory sensation. The polymucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be individuals.
                                                                                                                                                                                                                                                                                                                                                              ö
(also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different individuals.
                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; olfactory receptor; OR; primary scent determination; secondary scent determination; polypeptide library; odour receptor; scent profile; scent fingerprint; scent representation.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytokine activity; cell proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                   developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 441;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; SEQ ID NO 8874; 21pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the protein sequence for the Drosophila melanogaster imaginal disc growth factor 3 (IDGF3). The sequence encoding this protein was used to isolate the IDGF4 cooling sequence. IDGF4 is a member of the chitinase related proteins (CHRP) and is involved in the promotion of cell growth, motility and morphogenesis. The gene and promotion of cell growth, motility and morphogenesis. The gene and promoted to have mammalian homologues. They can be used in the treatment of cancer, wound healing, tissue regeneration following arthritis, osteoporosis, other skeletal disorders and burns, for evitalising scar tissue resulting from surgical procedures, irradiation, laceration, toxic chemicals, viral or bacterial infection or burns, to promote tissue growth during tissue engineering, for example tissues for skin graft replacements and bone regrowth, and to modulate the function of the female reproductive tract. In addition, they can also be used to increase meat, egg, sperm and milk production in animals. One possible method of use is by gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;

                                                                                                                                                                                                                                                                                                                                                                       human secreted proteins, and encode the proteins given in AAY11533 to human secreted proteins, and encode the proteins given in AAY11533 to AAY11679, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have crytokine activity, cell proteins obtained may have crytokine activity, cell proteins obtained may have crytokine activity, reproductive hormone regulating activity, tissue growth regulating activity, haematopoiesis regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity on other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cDNA encoding mouse flt3-ligand (flt3-L) was isolated from a cDNA library of T-cell line PTB-0.344 in CV-1/EBNA-1 cells using a slide autoradiography method. Flt3-L stimulates production of progenitor and stem cells, and can be used e.g.
